

Project Design Phase-I

Proposed Solution

Date	19 June 2026
Team ID	2023011032040
Project Name	AI-Based Threat Intelligence Platform
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in proposed solution template.

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Security Analysts at ABC Corporation (Who) are currently struggling to efficiently detect and respond to sophisticated cyber threats (What) across the organization's network and infrastructure (Where). As cyber attacks become more persistent and dynamic (When), analysts face alert fatigue and delayed response times due to manual data aggregation, highlighting the need for an AI-driven platform to automate correlation and prioritize real-time threats (Why).
2	Idea / Solution description	The solution is an AI-Based Threat Intelligence Platform that acts as a centralized brain for the organization's cybersecurity. The platform employs advanced machine learning algorithms to detect and analyze various types of cyber threats, including malware, phishing attempts, ransomware, and insider threats. It aggregates and correlates threat intelligence data from diverse sources, including internal logs and open-source feeds, enriching the data to provide actionable insights. Finally, it presents this data in a user-friendly interface with interactive dashboards and customizable reports for security analysts.
3	Novelty / Uniqueness	The novelty lies in shifting the organization's security posture from reactive to predictive. Leveraging predictive analytics capabilities, the platform identifies potential attack patterns and trends based on historical data and threat actor behavior. Instead of just alerting analysts that an attack is happening, the platform assesses risk exposure and vulnerability proactively, using AI to automatically weed out false positives and prioritize truly critical threats.

4	Social Impact / Customer Satisfaction	By automating manual data correlation, the platform significantly reduces 'alert fatigue' and burnout among security professionals, leading to higher job satisfaction and retention. From a business impact perspective, it ensures the robust protection of sensitive employee and customer data, safeguarding the organization's reputation and maintaining high trust levels with clients.
5	Business Model (Revenue Model)	Assuming the platform is developed to be sold as a product (B2B SaaS): The platform operates on a Business-to-Business (B2B) Software-as-a-Service (SaaS) subscription model. Revenue is generated through tiered monthly or annual licensing (e.g., Basic, Professional, Enterprise) based on the volume of network data ingested or the number of endpoints monitored. Additional revenue streams can include premium add-ons for advanced Dark Web monitoring feeds or custom API integrations with legacy systems.
6	Scalability of the Solution	The platform is inherently scalable due to its cloud-native infrastructure. It integrates seamlessly with existing security tools and infrastructure, such as SIEM systems, firewalls, and endpoint protection solutions. Because it supports standardized data formats and APIs, the platform can easily scale horizontally to ingest massive amounts of new network traffic and accommodate third-party security tools as the organization grows.
